

Overview

Wayfinding failures cluster at a small number of junctions.

This study asks where scanning breaks down on campus.

Signage budget is the usual framing; decision points fit better.

Methods

Twenty-four participants completed four timed trials each.

Junction events were logged by a researcher following at distance.

Think-aloud audio was transcribed and coded for uncertainty.

Findings

Median time to first correct turn was eleven seconds.
Backtracking concentrated at three unsigned junctions.
One added sign halved backtracks at the worst junction.
